

Hazardous Chemical Definitions

Poison Gas ----- Extremely dangerous poisons, highly toxic poisonous gases or liquids - a very small amount of the gas, or vapor of the liquid, mixed with air is dangerous to life.

Poison ---- Less dangerous poison , toxic - Substances, liquid or solids (including pastes, and semi-solids) so toxic to man that they are a hazard to health during transportation.

Flammable Gas ----- A gas that can burn with the evolution of heat and a flame. Flammable compressed gas is any compressed gas of which: (1) a mixture of 13 % or less (by volume) with air is flammable, or (2) the flammable range with air is under 12%.

Non-Flammable Gas ----- Any compressed gas other than a flammable compressed gas

Flammable Liquid ----- Any liquids having a flash point below 100 degrees F (37.8 degrees Q, except any mixture having components with flash points of 100 degrees F (37.8 degrees Q, or higher, the total of which makes up 99 % or more of the total volume of the mixture.

Combustible Liquid ----- Any liquid having a flash point at or above 100 degrees F (37.8 degrees Q, but below 200 degrees F (93.3 degrees Q, except any mixture having components with flash points of 200 degrees F (93.3 degrees Q, or higher, the total volume of which make up 99 % or more of the volume of the mixture

Corrosives - Liquid and Solid ----- Any liquid or solid that causes visible destruction or irreversible damage to human skin tissue, Also, it may be a liquid that has a severe corrosion rate on steel.

Irritating Material - Liquid and Solid ----- A liquid or solid substance which, upon contact with fire or air, gives off dangerous or intensely irritating fumes.

Explosive and Blasting Agent (Not Including Class C Explosives) ----- "Explosive" means a chemical that causes a sudden, almost instantaneous release of pressure, gas, and heat when subjected to sudden shock, pressure, or high temperature. "Blasting Agent" is a material designed for blasting. It must be so insensitive that there is very little probability of (1) accidental explosion or (2) going from burning to detonation.

Radioactive Material - (Yellow 1H Label) ----- Any material, or combination of materials, that spontaneously gives off ionizing radiation.

Flammable Solid (Dangerous When Wet) ----- Water Reactive Material (Solid) - Any solid

substance (including sludges and pastes) which react with water by igniting or giving off dangerous quantities of flammable or toxic gases.

Flammable Solid ----- A solid, other than a blasting agent, or explosive, that is liable to cause fire through friction, absorption of moisture, spontaneous chemical change, or retained heat from manufacturing or processing, or which can be ignited readily and when ignited burns so vigorously and persistently as to create a serious hazard,

Spontaneously Combustible Material ---- Spontaneously Combustible Material (Solid) - A solid substance (including sludges and pastes) which may undergo spontaneous heating or self-burning under normal transportation conditions. These materials may increase in temperature and ignite when exposed to air.

Oxidizer ----- A chemical that initiates or promotes combustion in other materials, thereby causing fire either of itself or through the release of oxygen or other gases. Example being: Chlorate, permanganate, inorganic peroxide, or a nitrate, that yields oxygen readily.

Organic Peroxide ----- Means an organic compound that contains the bivalent -O-O structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms has been replaced by an organic radical.

Carcinogen A chemical is considered to be a carcinogen if

- It has been evaluated by the International Agency for Research on Cancer (IARC), and found to be a carcinogen or potential carcinogen; or
- It is listed as a carcinogen or potential carcinogen in the Annual Report on Carcinogens published by the National Toxicology Program (NTP) (latest edition); or
- It is regulated by OSHA as a carcinogen.
